Review: Poisson brackets

Definition

A Poisson bracket $\{\cdot, \cdot\} : C^\infty(M) \times C^\infty(M) \rightarrow C^\infty(M)$ on a smooth manifold M is a skew-symmetric bi-derivation satisfying the Jacobi identity:

$$\{f, g\} = -\{g, f\},$$

$$\{f, g + h\} = \{f, g\} + \{f, h\},$$

$$\{f, gh\} = \{f, g\}h + g\{f, h\},$$

$$\{f, \{g, h\}\} + \{g, \{h, f\}\} + \{h, \{f, g\}\} = 0$$

$$\text{for all } f, g, h \in C^\infty(M)$$

In coordinates: $\{f, g\} = \Pi^{ij} \partial_i(f) \partial_j(g) = (f) \overset{i}{\leftarrow} \Pi^{ij} \overset{j}{\rightarrow} (g)$
for skew-symmetric matrix of functions Π^{ij} .

Deformation quantization of Poisson manifolds

Given

- $M \leftarrow$ smooth Poisson manifold with bracket $\{ , \}$.
- $C^\infty(M) \leftarrow$ smooth scalar functions on M , form a Poisson algebra under $\{ , \}$ and a commutative associative unital \mathbb{R} -algebra under $(fg)(x) = f(x)g(x)$.

Can we *deform* the product into $\star : A \times A \rightarrow A$ given by

$$f \star g = fg + \hbar B_1(f, g) + \hbar^2 B_2(f, g) + \dots \quad \text{for } f, g \in C^\infty(M),$$

while staying unital, **associative**, and such that

$$f \star g - g \star f = \hbar \{f, g\} + O(\hbar^2)?$$

Here the B_i are bi- $\{$ linear, differential $\}$ operators; $A = C^\infty(M)[[\hbar]]$.

Deformation quantization of Poisson manifolds

Given

- $M \leftarrow$ smooth Poisson manifold with bracket $\{ , \}$.
- $C^\infty(M) \leftarrow$ smooth scalar functions on M , form a Poisson algebra under $\{ , \}$ and a commutative associative unital \mathbb{R} -algebra under $(fg)(x) = f(x)g(x)$.

Can we *deform* the product into $\star : A \times A \rightarrow A$ given by

$$f \star g = fg + \hbar B_1(f, g) + \hbar^2 B_2(f, g) + \dots \quad \text{for } f, g \in C^\infty(M),$$

while staying unital, **associative**, and such that

$$f \star g - g \star f = \hbar \{f, g\} + O(\hbar^2)?$$

Here the B_i are bi-{linear, differential} operators; $A = C^\infty(M)[[\hbar]]$.
More wishful version: can we have $f \star g = fg + \hbar \{f, g\} + \mathcal{O}(\hbar^2)$?

Deformation quantization of Poisson manifolds, I

M. Kontsevich (1997): Yes we can!

Explicitly, on an affine manifold, let $\{f, g\} = \sum_{i,j} \Pi^{ij} \partial_i f \partial_j g$,

Then a star product is given (up to order 2) by

$$\begin{aligned} f \star g = & fg + \hbar \Pi^{ij} \partial_i f \partial_j g + \\ & \hbar^2 \left(\frac{1}{2} \Pi^{ij} \Pi^{kl} \partial_i \partial_k f \partial_j \partial_l g + \frac{1}{3} \Pi^{ij} \partial_j \Pi^{kl} \partial_i \partial_k f \partial_l g + \frac{1}{3} \Pi^{ij} \partial_j \Pi^{kl} \partial_k f \partial_i \partial_l g \right) \\ & + \mathcal{O}(\hbar^3). \end{aligned}$$

Deformation quantization of Poisson manifolds, I

M. Kontsevich (1997): Yes we can!

Explicitly, on an affine manifold, let $\{f, g\} = \sum_{i,j} \Pi^{ij} \partial_i f \partial_j g$,

Then a star product is given (up to order 2) by

$$\begin{aligned} f \star g = & fg + \hbar \Pi^{ij} \partial_i f \partial_j g + \\ & \hbar^2 \left(\frac{1}{2} \Pi^{ij} \Pi^{kl} \partial_i \partial_k f \partial_j \partial_l g + \frac{1}{3} \Pi^{ij} \partial_j \Pi^{kl} \partial_i \partial_k f \partial_l g + \frac{1}{3} \Pi^{ij} \partial_j \Pi^{kl} \partial_k f \partial_i \partial_l g \right) \\ & + \mathcal{O}(\hbar^3). \end{aligned}$$

Explicit *universal* formula in terms of (derivatives of) Poisson bi-vector components Π^{ij} , at all orders in \hbar .

Deformation quantization of Poisson manifolds, I

M. Kontsevich (1997): Yes we can!

Explicitly, on an affine manifold, let $\{f, g\} = \sum_{i,j} \Pi^{ij} \partial_i f \partial_j g$,

Then a star product is given (up to order 2) by

$$\begin{aligned} f \star g = & fg + \hbar \Pi^{ij} \partial_i f \partial_j g + \\ & \hbar^2 \left(\frac{1}{2} \Pi^{ij} \Pi^{kl} \partial_i \partial_k f \partial_j \partial_l g + \frac{1}{3} \Pi^{ij} \partial_j \Pi^{kl} \partial_i \partial_k f \partial_l g + \frac{1}{3} \Pi^{ij} \partial_j \Pi^{kl} \partial_k f \partial_i \partial_l g \right) \\ & + \mathcal{O}(\hbar^3). \end{aligned}$$

Explicit *universal* formula in terms of (derivatives of) Poisson bi-vector components Π^{ij} , at all orders in \hbar .

Where does it come from? Sum of weighted graphs:

$$f \star g = fg + \sum_{n=1}^{\infty} \frac{\hbar^n}{n!} \left(\sum_{\Gamma \in \mathcal{G}_n} w(\Gamma) B_{\Gamma}(f, g) \right)$$

Graphs and weights

Graphs

Kontsevich graphs in G_n ($n \geq 1$):

- n *internal* vertices; each has two *ordered* outgoing edges,
- two ordered *ground* vertices without outgoing edges,
- no tadpoles.

Table 1: Some Kontsevich graphs ($n \leq 2$).

NB: Ordering of edges in pictures is Left \prec Right.

Graphs

Kontsevich graphs in G_n ($n \geq 1$):

- n *internal* vertices; each has two *ordered* outgoing edges,
- two ordered *ground* vertices without outgoing edges,
- no tadpoles.

Table 1: Some Kontsevich graphs ($n \leq 2$).

NB: Ordering of edges in pictures is Left \prec Right.

Operators

Recipe for bi-differential operator B_Γ associated to graph Γ :

- label edges from internal vertex with indices, say i, j ,
- substitute Poisson bi-vector component Π^{ij} into the vertex,
- substitute arguments f, g into ground vertices,
- incoming edge i acts as derivative ∂_i on target vertex,
- multiply (differentiated) contents of vertices,
- sum over all indices.

$$\Pi^{ij} \partial_i \otimes \partial_j$$

$$\Pi^{ij} \Pi^{kl} \partial_i \partial_k \otimes \partial_j \partial_l$$

$$\Pi^{ij} \partial_j \Pi^{kl} \partial_i \partial_k \otimes \partial_l$$

$$\partial_r \Pi^{ij} \partial_j \Pi^{kl} \partial_i \otimes \partial_l$$

Table 2: Some bi-differential operators associated to graphs.

Star product

Kontsevich's star product is given up to $\mathcal{O}(\hbar^2)$ by

$$\bullet \star \bullet = \bullet \bullet + \hbar \left(\text{triangle} \right) + \hbar^2 \left(\frac{1}{2} \text{triangle} + \frac{1}{3} \text{triangle} + \frac{1}{3} \text{triangle} + \frac{1}{6} \text{triangle} \right) + \mathcal{O}(\hbar^3).$$

$$f \star g = fg + \hbar \Pi^{ij} \partial_i f \partial_j g + \hbar^2 \left(\frac{1}{2} \Pi^{ij} \Pi^{kl} \partial_i \partial_k f \partial_j \partial_l g + \frac{1}{3} \Pi^{ij} \partial_j \Pi^{kl} \partial_i \partial_k f \partial_l g + \frac{1}{3} \Pi^{ij} \partial_j \Pi^{kl} \partial_k f \partial_i \partial_l g + \frac{1}{6} \partial_k \Pi^{ij} \partial_j \Pi^{kl} \partial_i f \partial_l g \right) + \mathcal{O}(\hbar^3).$$

- Now, about those weights $w(\Gamma)$.

Embedding the graphs in $\bar{\mathbb{H}}$

- Now, about those weights $w(\Gamma)$.
- Embed Γ in $\mathbb{H} \cup \mathbb{R} \subset \mathbb{C}$:
 - the two ground vertices at $\{0, 1\} \subset \mathbb{R}$,
 - internal vertices at pairwise distinct points,
 - edges as geodesics w.r.t. hyperbolic metric, i.e. vertical lines and circular segments.

Embedding the graphs in $\bar{\mathbb{H}}$

- Now, about those weights $w(\Gamma)$.
- Embed Γ in $\mathbb{H} \cup \mathbb{R} \subset \mathbb{C}$:
 - the two ground vertices at $\{0, 1\} \subset \mathbb{R}$,
 - internal vertices at pairwise distinct points,
 - edges as geodesics w.r.t. hyperbolic metric, i.e. vertical lines and circular segments.
- Hyperbolic angle between vertices $p, q \in \mathbb{H}$:

$$\varphi(p, q) = \text{Arg} \left(\frac{q - p}{q - \bar{p}} \right).$$

Definition

The *weight* of a Kontsevich graph $\Gamma \in G_n$ is given by the integral

$$w(\Gamma) = \frac{1}{(2\pi)^{2n}} \int_{C_n(\mathbb{H})} \bigwedge_{k=1}^n d\varphi(p_k, p_{\text{Left}(k)}) \wedge d\varphi(p_k, p_{\text{Right}(k)}),$$

over $C_n(\mathbb{H}) = \{(p_1, \dots, p_n) \in \mathbb{H}^n : p_i \text{ pairwise distinct}\}$.

For example,

$$\begin{aligned} w \left(\begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} \right) &= \int_{C_1(\mathbb{H})} d\varphi(p, 0) \wedge d\varphi(p, 1) \\ &= \frac{1}{(2\pi)^2} \int_{-\infty}^{\infty} dx \int_0^{\infty} dy \frac{4y}{((x-1)^2 + y^2)(x^2 + y^2)} = \frac{1}{2}. \end{aligned}$$

Formal series of graphs

Our approach: formal series of graphs, modulo ...

- For a fixed Poisson structure we have a correspondence

$$\Gamma \mapsto B_\Gamma.$$

- Can extend it to formal sums of graphs:

$$\sum w_\Gamma \Gamma \mapsto \sum w_\Gamma B_\Gamma.$$

- What is in the kernel, for all Poisson structures?

Our approach: formal series of graphs, modulo ...

- For a fixed Poisson structure we have a correspondence

$$\Gamma \mapsto B_\Gamma.$$

- Can extend it to formal sums of graphs:

$$\sum w_\Gamma \Gamma \mapsto \sum w_\Gamma B_\Gamma.$$

- What is in the kernel, for all Poisson structures?
- Skew-symmetry, and (differential consequences of) Jacobi.

Our approach: formal series of graphs, modulo ...

$$\sum w_\Gamma \Gamma \mapsto \sum w_\Gamma B_\Gamma.$$

- What is in the kernel, for all Poisson structures?
- Skew-symmetry, and (differential consequences of) Jacobi.
- **Main idea:** We consider formal sums modulo these things.

Illustration 1: Associativity up to order 2

Recall:

$$\bullet \star \bullet = \bullet \bullet + \hbar \begin{array}{c} \bullet \\ \swarrow \searrow \\ \bullet \quad \bullet \end{array} + \hbar^2 \left(\frac{1}{2} \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} + \frac{1}{3} \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} + \frac{1}{3} \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} + \frac{1}{6} \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} \right) + \mathcal{O}(\hbar^3).$$

- Expand associator $(f \star g) \star h - f \star (g \star h)$ in terms of graphs:

$$\sum_{n=0}^{\infty} \hbar^n \sum_{r+s=n} B_r(B_s(f, g), h) - B_r(f, B_s(g, h)).$$

Graphs act on graphs by the (iterated) Leibniz rule.

- Collect terms by using the skew-symmetry.
- What remains at \hbar^2 : $\frac{2}{3}$ multiplied by

$$\begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} - \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} - \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \end{array} = \text{Jac}_{\Pi}(f, g, h) = 0.$$

Illustration 2: Associativity up to order 3

$$\begin{aligned}
 \bullet \star \bullet &= \bullet \bullet + \hbar \left(\text{triangle} \right) + \hbar^2 \left(\frac{1}{2} \left(\text{triangle} \right) + \frac{1}{3} \left(\text{triangle} \right) + \right. \\
 &\quad \left. \frac{1}{3} \left(\text{triangle} \right) + \frac{1}{6} \left(\text{triangle} \right) \right) + \hbar^3 \left(\frac{1}{6} \left(\text{triangle} \right) + \right. \\
 &\quad \frac{1}{6} \left(\text{triangle} \right) + \frac{1}{6} \left(\text{triangle} \right) + \frac{1}{6} \left(\text{triangle} \right) + \\
 &\quad \frac{1}{6} \left(\text{triangle} \right) + \frac{1}{6} \left(\text{triangle} \right) + \frac{1}{3} \left(\text{triangle} \right) + \frac{1}{3} \left(\text{triangle} \right) + \\
 &\quad \left. \frac{1}{6} \left(\text{triangle} \right) + \frac{1}{6} \left(\text{triangle} \right) + \frac{1}{6} \left(\text{triangle} \right) + \frac{1}{6} \left(\text{triangle} \right) \right) + \mathcal{O}(\hbar^4)
 \end{aligned}$$

Expand $(f \star g) \star h - f \star (g \star h)$ graphically \rightsquigarrow 39 terms at \hbar^3 .
 Vanishing is (differential) consequence of Jacobi, but how?

Jacobi identity and its differential consequences

We consider the Jacobiator as a tri-differential operator, we look at the differential consequences of its vanishing, and restrict to fixed total differential orders.

$$\text{Jac}_{\Pi}(f, g, h) = \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} - \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} \begin{array}{c} L \\ \swarrow \\ \bullet \\ \searrow \\ R \end{array} - \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} = 0,$$

$$\Pi^{ij} \partial_j \text{Jac}_{\Pi}(\partial_i f, g, h) = \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} - \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} \begin{array}{c} L \\ \swarrow \\ \bullet \\ \searrow \\ R \end{array} - \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} = 0,$$

$$\frac{2}{3} \Pi^{ij} \text{Jac}_{\Pi}(\partial_i f, \partial_j g, h) = \frac{2}{3} \left(\begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} - \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} \begin{array}{c} L \\ \swarrow \\ \bullet \\ \searrow \\ R \end{array} - \begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \\ f \quad g \quad h \end{array} \right) = 0.$$

Jacobi identity and its differential consequences, continued

$$\begin{aligned} & \left(\begin{array}{c} \text{Diagram 1} \\ \text{Diagram 2} \end{array} + \begin{array}{c} \text{Diagram 3} \\ \text{Diagram 4} \end{array} \right) \\ & - \left(\begin{array}{c} \text{Diagram 5} \\ \text{Diagram 6} \end{array} + \begin{array}{c} \text{Diagram 7} \\ \text{Diagram 8} \end{array} \right) \\ & - \left(\begin{array}{c} \text{Diagram 9} \\ \text{Diagram 10} \end{array} + \begin{array}{c} \text{Diagram 11} \\ \text{Diagram 12} \end{array} \right) = 0. \end{aligned}$$

The diagrams are 3D-like structures with 4 vertices on a horizontal base line and 1 vertex above. Arrows indicate connections between vertices. The letter 'R' is placed near some arrows to denote a specific operation or relation.

Jacobi identity and its differential consequences, continued

$$\begin{aligned} & \left(\begin{array}{c} \text{Graph 1} \\ \text{Graph 2} \end{array} \right) + \left(\begin{array}{c} \text{Graph 3} \\ \text{Graph 4} \end{array} \right) \\ - & \left(\begin{array}{c} \text{Graph 5} \\ \text{Graph 6} \end{array} \right) + \left(\begin{array}{c} \text{Graph 7} \\ \text{Graph 8} \end{array} \right) \\ - & \left(\begin{array}{c} \text{Graph 9} \\ \text{Graph 10} \end{array} \right) + \left(\begin{array}{c} \text{Graph 11} \\ \text{Graph 12} \end{array} \right) = 0. \end{aligned}$$

The diagram shows a sequence of three rows of graph sums. Each row contains two graphs in parentheses, separated by a plus sign. The first row shows two graphs with a vertex labeled 'R'. The second row shows two graphs with a vertex labeled 'R'. The third row shows two graphs with a vertex labeled 'R'. The entire expression is set equal to zero.

Moral: looking at formal sums of graphs is useful, since we can identify/construct differential consequences of the Jacobi identity graphically.

Illustration 3: undetermined weights & finding relations

For $n \geq 3$ direct integration becomes hard.

Start with undetermined weights, then find relations:

- skew-symmetry of graphs and weights,
- weight of mirror reflection of $\Gamma \in G_n$ is $(-1)^n w(\Gamma)$,
- for some graphs the weight integrand vanishes,
- multiplicativity of the weight; factorization into primes:

- cyclic weight relations ({Willwacher, Shoikhet}–Felder),
- formula is universal, so holds for *all* Poisson bi-vectors: substitute Π into \star with undetermined weights & solve associativity equation.

Primitive set of graphs

Definition (Primitive set of graphs)

A set of graphs is called *primitive* (or *basic*) if it contains only

- prime graphs
- of positive differential order,

and only one representative per equivalence class modulo {skew-symmetry, mirror reflections} is contained in the set.

Weights of all graphs are expressed via weights of basic graphs.

Strategy:

- generate basic set of graphs,
- find relations between their weights.

Substitution

The star product formula is *universal*, so it is associative for every Poisson structure.

- Evaluate associator at particular point for particular Π .
- For Π depending on a set of arbitrary functions $\{F_i\}$, consider the associator as a differential operator on f, g, h and the F_i .

This yields relations between the weights.

Remark: associator's $(1, 2, 3) \leftarrow (3, 3), (1, 5)$ have no primes at $\hbar^4 \implies$ relations between weights at order 3.

Result

At order 3 we have 15 basic graphs.

- Integrands vanishing: 1.
- Cyclic weight relations up to order 3.
- Substitute generic 3d Poisson, in associator up to order 4.

↪ know all weights exactly, without calculating any integrals!

Result

At order 3 we have 15 basic graphs.

- Integrands vanishing: 1.
- Cyclic weight relations up to order 3.
- Substitute generic 3d Poisson, in associator up to order 4.

↪ know all weights exactly, without calculating any integrals!

At order 4 we have 149 basic graphs.

- Integrands vanishing: 21.
- Cyclic weight relations up to order 6.
- Relations from associativity up to order 5 (in progress).

We *solve* the linear system of relations. This yields:

- 67 are now known exactly,
- 82 expressed via ≤ 10 .

Conclusion: summary of results

Universal w.r.t. all Poisson structures:

- We understand factorization of associativity! (Lemma)
- The \star -product mod $\mathcal{O}(\hbar^4)$ known exactly.
- New linear relations between weights $w(\Gamma \in G_4)$ from \star mod $\mathcal{O}(\hbar^6) \rightsquigarrow$ in progress.
- 149 weights: 67 exactly, 82 via only ≤ 10 (in progress).
- Strategy to find weights fully implemented in software.
- Factorization algorithm applied to solve another problem (on tetrahedral flows).

R. Buring and A. V. Kiselev.

On the Kontsevich \star -product associativity mechanism.

In *SQS'15 proceedings*, 2016.

arXiv:1602.09036 [math.QA].

R. Buring and A. V. Kiselev.

Software modules and computer-assisted proof schemes in the Kontsevich deformation quantization.

In writing, 2016.

See <http://github.com/rburing/kontsevich-graph-series-cpp> for code.

M. Kontsevich.

Formality conjecture.

In Deformation Theory and Symplectic Geometry, pages 139–156. Kluwer, Dordrecht, 1997.

M. Kontsevich.

Deformation quantization of Poisson manifolds, I.

Lett. Math. Phys., 66:157 – 216, 2003.
